

BUSINESS CONCERN

Question 3

What were the top Australian news topics over the last decade, and what can these say about the national conversation?

Significance

The question topic describes to answer two main questions using the data

-> To identify the top Australian news topics over the last decade

-> To understand the national conversation based on the top news topics

KEY STAKEHOLDERS

- 1) community defines as the general public who are interested in news
- 2) News Media
- 3) Australian News Organisation
- 4) Australian Press Council

APPROACH

- 1) To address this business concern the data is collected from kaggle and loaded.
- 2) After collection of data, the data is examined so that the data collected is relevant as per the question requirement.
- 3) selecting the data of the last decade and examining the data again and address the issue of any null values.
- 4) Converting the upper case letter to lower case.
- 5) Tokenizing is useful in splitting up a large body of into small text. the tokenizing method is used to because the data contains a large number of text and will help in selecting smaller lines of text for processing.
- 6) Implementing porter stemmer technique for processing the text as part of text analysis.
- 7) removing the stopword from the stemmed words.
- 8) rejoining the words.
- 9) selecting the date in order display the data of the last decade.
- 10) Displaying the top 20 most occurring news topics.
- 11) Implementing TF-IDF and LDA method for identifying term frequency and probabilistic topic modeling.
- 12) The visualization of data is applied using wordcloud to identify the top topics in from the dataframe.

LIBRARIES

The wordcloud is used to represent the frequency or the importance of every word in the abc news dataset. furthermore, the nltk is used to create a break the text into small chunk of information in the form of words and sentences. pandas and numpy libraries are used because structures and data analysis tools. whereas, numpy enables objects for multi-dimensional arrays and pandas provide a table called dataframe. the gensim library is implemented because it will enable us to use latent dirichlet allocation (LDA) which does topic modelling.

In [3]:

```
#install Packages
!pip install wordcloud
!pip install nltk
import sys
!{sys.executable} -m pip install gensim

[nltk_data] Package stopwords is already up-to-date!

LOADING THE DATA

The data for analysis is first loaded into jupyter notebook. here the abcnews data is loaded by creating a file and the loading the file into the dataframe. the later calling the dataframe in order display the information present in abcnews dataset.

In [4]:

```
file = "C:/Users/karth/Assignment 1 Part B/Question 3/abcnews-date-text.csv"

#load the data into pandas data frame
abc_df = pd.read_csv(file)
```

DATA EXAMINATION

Firstly i need check the overall shape and the layout of my dataset.

In [5]:

```
num_rows = abc_df.shape[0]
num_cols = abc_df.shape[1]

print("There are %d rows and %d cols in the dataset abc_news" %(num_rows, num_cols))
```

There are 1186018 rows and 2 cols in the dataset abc_news

Using the head function displayed the first n rows. this was usefull because it provided me with the nessassary information about the type of data the it was holding.

In [6]:

```
abc_df.head()

Out[6]:
```

	publish_date	headline_text
0	20030219	aba decides against community broadcasting lic...
1	20030219	act fire witnesses must be aware of defamation
2	20030219	a g calls for infrastructure protection summit
3	20030219	air nz staff in aust strike for pay rise
4	20030219	air nz strike to affect australian travellers

To check wheather the dataset contains any null values i have used isnull.

In [7]:

```
abc_df.isnull().sum()
```

Out[7]:

```
publish_date    0
headline_text    0
dtype: int64
```

Although using previous fuction we can see the variables of the columns. since we are doing a detailed analysis we need to check the coloumn variables hence the below fuction is used.

In [8]:

```
vars = abc_df.columns.tolist()
vars
```

Out[8]:

```
['publish_date', 'headline_text']
```

Since the question is focusing on the top conversation in australia over the last decade. we need to understand which were the most words and by doing this we can understand wheather those words can affect any news conversation. as displayed below in the output most of the words are irrerralvant and provide litte information about the conversation.

In [10]:

```
Num_Word = pd.Series('').join(abc_df.headline_text).split()).value_counts()
Num_Word
```

Out[10]:

```

DATA PROCESSING

I have converted the information present in headline_text to lower case becuase when i will be creating corpus in english. the model could treat capital letter differently which are starting from the beginning of sentence.thus, resulting in uneven analysis.

```
In [11]:
abc_df['headline_text'] = abc_df['headline_text'].str.lower()
abc_df

Out[11]:
```

1186018 rows × 2 columns

During this stage of processing i want look only at the contents provided in the first row to understand how the headlines might look like.

```
In [12]:
news_example = abc_df.iloc[0]
print(news_example['headline_text'])

aba decides against community broadcasting licence
```

TOKENIZATION

The word tokenize method is implemented from nltk to split the news data into in single set of words. first it is used for only one of the sentence is the news dataset because to check wheater it is fuctioning properly. afterwards, in the below line of the code the word tokenization is applied to all the sentences in the dataset and also makes a new column called words in the dataframe. the use "isalnum" will allow us to keep the numbers form the dataset as well.

In [13]:

```
print (nlk.word_tokenize(news_example['headline_text']))
```

['aba', 'decides', 'against', 'community', 'broadcasting', 'licence']

In [14]:

```
def identify_tokens(row):
    news = row['headline_text']
    tokens = nlk.word_tokenize(news)
    # taken only words (not punctuation)
    token_words = [w for w in tokens if w.isalnum()]
    return token_words

abc_df['words'] = abc_df.apply(identify_tokens, axis=1)
```

STEMMING

The process of stemming is used to because it reduces the related words to a common stem and is nessassary in order to test the accuracy. Porter stemmer is used because it will enable in removing the inflexional endings and morophological words in english and is necessary for normalizing the process of terms. and it will help in further processing of the data set analysis.

PORTER STEMMER

Firstly we are cheking for the first sentence in the data by creating a list of words and applying stemming process to the list of words. futher, the porter stemmer is applied to whole dataset and creating the new column named "stemmed_words" and then displaying in the output.

In [17]:

```
from nltk.stem import PorterStemmer
stemming = PorterStemmer()

news_list = ['aba', 'decides', 'against', 'community', 'broadcasting', 'licence']

# Using a Python list comprehension method to apply to all words in my_list

print ([stemming.stem(word) for word in news_list])

['aba', 'decid', 'against', 'commun', 'broadcast', 'licenc']
```

In [18]:

```
def stem_list(row):
    news_list = row['words']
    stemmed_list = [stemming.stem(word) for word in news_list]
    return (stemmed_list)

abc_df['stemmed_words'] = abc_df.apply(stem_list, axis=1)
```

In [19]:

```

REMOVING OF STOP WORDS

During the process of examining the data we came across some the words such as "to" "in" etc, which are considered to be stopwords. it is essential to remove such words for the data set because there contribution seems to be very limited in order to understand the conversation of the news dataset.hence, i have defined the fuction and applied it to our dataframe. then i have created the set of words and called "stop_words". becuse creating set will be faster in removal of stop words.

In [20]:

```
stop_word = set(stopwords.words("english"))

def remove_stops(row):
    my_list = row['stemmed_words']
    meaningful_words = [w for w in my_list if not w in stop_word]
    return (meaningful_words)

abc_df['processed_stem'] = abc_df.apply(remove_stops, axis=1)
```

ANALYSIS

After process the whole the data set we will move towards analysis the data and through this analysis answering the question. the dictates that we need to identify the top conversion over the last decade. therefore, we are selecting the dates from over the last decade. since the dates are in the form of arugment we are converting into datetime.

In [24]:

```
abc_df['publish_date'] = pd.to_datetime(abc_df['publish_date'], format='%Y%m%d')

675713 rows × 6 columns

Below i have now displayed to 20 most ocuring words in the news dataset after removing the stopwords we can now see police has the highest frequency and it somehow relates to the news conversation

In [41]:

```
# Text Analysis libraries
from sklearn.feature_extraction.text import TfidfVectorizer
from sklearn.pipeline import make_pipeline
from sklearn.feature_extraction.text import CountVectorizer
import gensim
from tqdm import tqdm
tqdm.pandas(desc="progress-bar")
from gensim.models.doc2vec import LabeledSentence

cv = CountVectorizer(stop_words = 'english')
words = cv.fit_transform(Filter_List.processed_convo)

sum_words = words.sum(axis=0)

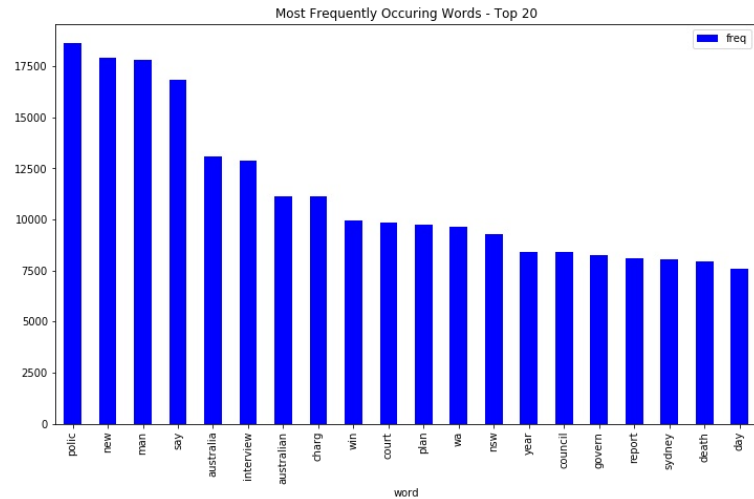

words_freq = [(word, sum_words[0, i]) for word, i in cv.vocabulary_.items()]
words_freq = sorted(words_freq, key = lambda x: x[1], reverse = True)

frequency = pd.DataFrame(words_freq, columns=['word', 'freq'])

frequency.head(20).plot(x='word', y='freq', kind='bar', figsize=(12, 7), color = 'blue')
plt.title("Most Frequently Occurring Words - Top 20")
```

Out[41]:

Text(0.5, 1.0, 'Most Frequently Occurring Words - Top 20')

In [42]:

```
def sent_to_words(sentences):
    for sentence in sentences:
        yield(gensim.utils.simple_preprocess(str(sentence), deacc=True)) # deacc=True removes punctuations

df = list(sent_to_words(Filter_List['processed_convo']))

print(df[:1])

[['dega', 'stolen', 'museum']]
```

In [43]:

```

TF-IDF

The TF-IDF is used because it allowed me to use scoring measure. if the word occurs multiple times in a document it allows me to boost its relevance this was implemented because we can easily find out the most relevant topics.

In [44]:

```
#convert the words into bag of words format
vocab = [vocab.doc2bow(words) for words in df]

#Adjusting the tf-idf model to the corpus
model = TfIdfModel(corpus)

#apply for the first dato
tfidf_doc = model[corpus[0]]
```

In [45]:

LDA

To discover the topics that are abstract and occur in a collection of documents is known as topic modeling and LDA is an example of one such Topic modeling. With LDA we can classify a text in a document to a particular topic. With the help of the LDA I have built a topic per document and word per topic model as distributions of Dirichlet.

In [54]:

```
#create an lda
lda_model = LdaModel(corpus=corpus, id2word=vocab, num_topics=20)
lda_model
```

VISUALISATION

In the below diagram i have developed an interactive topic model visualization. with the pyLDAvis the stakeholders can interact with the topics presented i the topic model, which has be set to a corpus of the text data.

In [59]:

```
pyLDAvis.enable_notebook()
vis = pyLDAvis.gensim.prepare(lda_model, corpus, vocab)
vis
```

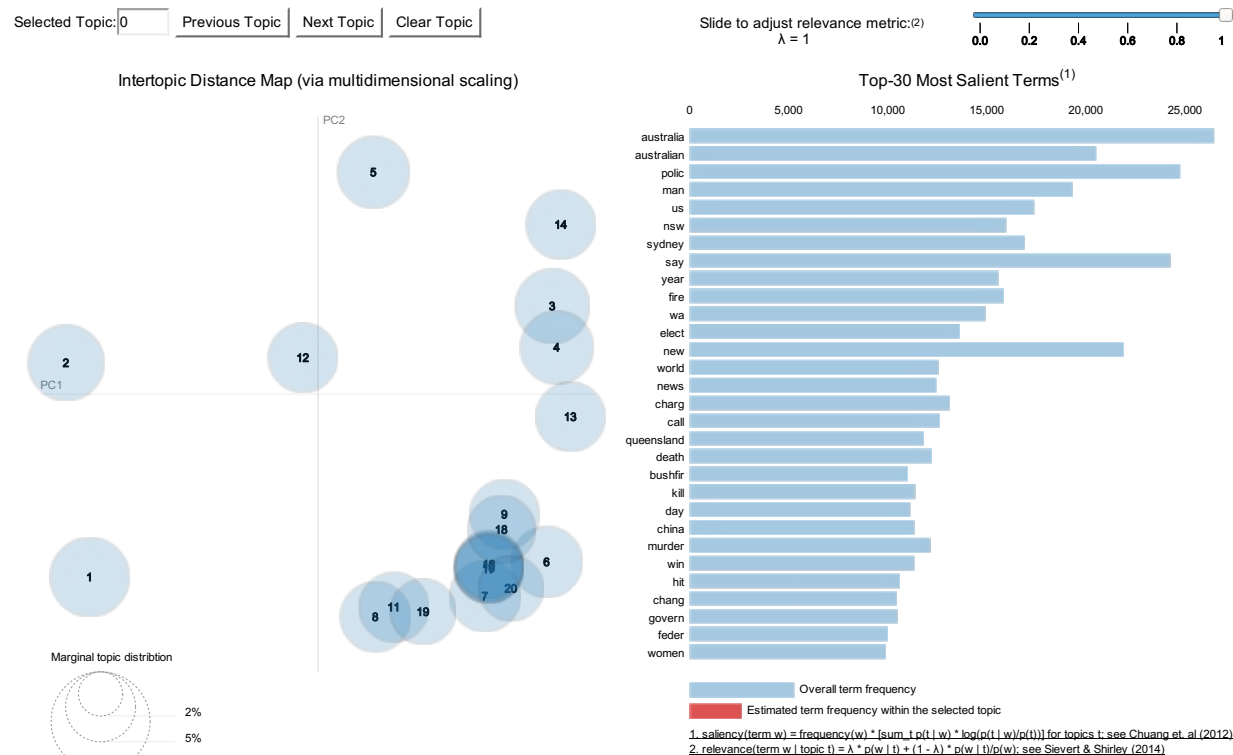

C:\Users\karth\Anaconda3\lib\site-packages\pyLDAvis_prepare.py:257: FutureWarning: Sorting because non-concatenation axis is not aligned. A future version of pandas will change to not sort by default.

To accept the future behavior, pass 'sort=False'.

To retain the current behavior and silence the warning, pass 'sort=True'.

```
return pd.concat([default_term_info] + list(topic_dfs))
```

Out[59]:

Creating the wordcloud will help in better understanding of the words that were used and based on the below words we can conclude the top conversation in australia over the last decade.

In [185]:

```
vis_abc_df = ','.join(map(str, list(Filter_List['processed_convo'].values)))
wordcloud = WordCloud(background_color = "white", max_words=50, contour_width=6, contour_color='steelblue')
wordcloud.generate(vis_abc_df)
wordcloud.to_image()
```

Out[185]:

SUMMARY

The process of this analysis is based around answering the question. hence, to analyze the question i have divided the question into two parts. in the above analysis i have found out the top topic over the last decade and displayed them in the form of wordcloud. furthermore, to achieve this i implemented some of the text analysis process and topic modeling. firstly, i collected the data from kaggle.com the link provided for the question 3 in assignment 1 part b. then examined the dataset by checking the shape and layout. then i checked the dataset for any null values present in the dataset and there were no null values this made the process easier. since the the topic is about conversation and deals with textual data i retrived the counts of each word by counting the number of words. after examining this data i identified there were many unrealated data such as "to", "the" etc. before moving towards the stopword removal data i implemented the tokenizing and stemming process. because some of the stopwards may end up giving meaning to the actual conversation. therefore, i performed proter stemmer then implemented stopwords removals. this enabled in providing better accuracy when using Term frequency inverse document frequency(TF-IDF). The TF-IDF was enough for visualisation process. but implementing LDA helped addressing the shortcomings of TF-IDF because LDA uses probabilistic model which helped in estimating the probability distributions for topics words and documents. lastly, the wordcloud consist of some words like "new", "plan", "Australia" etc. this shows that the top conversation over the last decade were based on the topics displayed in the wordcloud. To understand the top conversation we need to look at the LDA model. Topics such as 4,20,2,7,10,11,18 gives us some idea about what were top convesation over the last decade and defines the national conversation of australia. there two such clusters in the LDA model which gives the overall conversation summary.

FINAL INSIGHT

The Top news topics are provided in the LDA model when examining the cluster of data and wordcloud. if we select the topic 4 we can understand the conversation top most relevant convesation is related to "australian bushfire" and "austrian elections" if we compare it with the other relevant topics surrounding topic which are clustered together, we can see that they consist some of the conversation which are simliar to all the topics. one such conversation is realted to "scientist" and "politician" which is present in all the topics. Through this LDA model the stakeholders such as news agency, newspaper organisations can understand the area in which they covered the news over the last decade and understand its importance.

In the LDA model there is another cluster of topics, we can see in the most relvant topic terms are "NSW", "china" and "kill". same as the above the similar topics here which are "health" and "doctor". the combination of the clusters of data we can conclude that top conversation over the last decade is related to some of the topics mentioned above. this analysis will help the stakeholders such as Australian newspaper organisation or Australian Press Council to understand topic that they covered over the last decade and will help them identify the converstation and what it says about australia.
